

Flows and invariance for elliptic operators

A.F.M. ter Elst¹, Derek W. Robinson² and Adam Sikora³

Abstract

Let S be the submarkovian semigroup on $L_2(\mathbf{R}^d)$ generated by a self-adjoint, second-order, divergence-form, elliptic operator H with $W^{1,\infty}$ coefficients c_{kl} . Further let Ω be an open subset of $\mathbf{R}^d$. Under mild conditions we prove that S leaves $L_2(\Omega)$ invariant if, and only if, it is invariant under the flows generated by the vector fields $\sum_{l=1}^d c_{kl} \partial_l$ for all k .

1 Introduction

Let S be a submarkovian semigroup on $L_2(\mathbf{R}^d)$ generated by a self-adjoint second-order elliptic operator H in divergence form. If the operator is strongly elliptic then S acts ergodically, i.e. there are no non-trivial S -invariant subspaces of $L_2(\mathbf{R}^d)$. Nevertheless there are many examples of degenerate elliptic operators for which there are subspaces $L_2(\Omega)$ invariant under the action of S (see, for example, [ERSZ2] [ERSZ1] [RoS1] [ElR1]). Our aim is to examine operators with coefficients which are Lipschitz continuous and characterize the S -invariance of $L_2(\Omega)$ by the invariance under a family of associated flows. In order to formulate our main result we need some further notation.

First define the positive symmetric operator H_0 with domain $D(H_0) = C_c^\infty(\mathbf{R}^d)$ and action

$$H_0\varphi = - \sum_{k,l=1}^d \partial_k c_{kl} \partial_l \varphi$$

where the coefficients $c_{kl} = c_{lk} \in W^{1,\infty}(\mathbf{R}^d)$ are real and $C = (c_{kl})$ is a positive-definite matrix over $\mathbf{R}^d$. Then the corresponding quadratic form h_0 given by

$$h_0(\varphi) = \sum_{k,l=1}^d (\partial_k \varphi, c_{kl} \partial_l \varphi)$$

with domain $D(h_0) = C_c^\infty(\mathbf{R}^d)$ is closable. The closure $h = \overline{h_0}$ determines in a canonical manner a positive self-adjoint extension H of H_0 , the Friedrichs' extension [Fri] (see, for example, [RSN], §124, or [Kat], Chapter VI). The closed form h is a Dirichlet form and the self-adjoint semigroup S generated by H is automatically submarkovian (for details on Dirichlet forms and submarkovian semigroups see [FOT] or [BoH]). We call H the degenerate elliptic operator with coefficients (c_{kl}) .

Secondly, if $b_1, \dots, b_d \in W^{1,\infty}(\mathbf{R}^d)$ then the first-order partial differential operator

$$\varphi \mapsto \sum_{k=1}^d b_k \partial_k \varphi - \frac{1}{2} \sum_{k=1}^d (\partial_k b_k) \varphi$$

with domain $C_c^\infty(\mathbf{R}^d)$ is essentially skew-adjoint (see, for example, [Rob1], Theorem 3.1). Therefore the principal part is closable and generates a positive, continuous, one-parameter group on $L_2(\mathbf{R}^d)$. We refer to such a group as flows. Specifically we are interested in the flows associated with the coefficients (c_{kl}) of H . For all $k \in \{1, \dots, d\}$ let Y_k denote the L_2 -closures of the first-order partial differential operator

$$\varphi \mapsto \sum_{l=1}^d c_{kl} \partial_l \varphi$$

with domain $C_c^\infty(\mathbf{R}^d)$. Then denote by $T^{(k)}$ the flows generated by the Y_k . The operators Y_k were used by Oleřnik and Radkevič [OIR] to analyze hypoellipticity and subellipticity properties of degenerate elliptic operators H with C^∞ -coefficients c_{kl} (see [JeS] for a review of these and related results). We, however, use the flows to characterize the invariant subspaces of the semigroup generated by H .

Theorem 1.1 *Let Ω be a measurable subset of $\mathbf{R}^d$. Consider the following conditions.*

- I. $S_t L_2(\Omega) \subseteq L_2(\Omega)$ for all $t > 0$.
- II. $T_t^{(k)} L_2(\Omega) = L_2(\Omega)$ for all $k \in \{1, \dots, d\}$ and $t \in \mathbf{R}$.

Then $\text{I} \Rightarrow \text{II}$. Moreover, if $C_c^\infty(\mathbf{R}^d)$ is a core for H , or, if Ω is open and the boundary $\partial\Omega$ of Ω is (locally) Lipschitz then $\text{I} \Leftrightarrow \text{II}$.

Recall that the open set Ω is defined to have a (locally) Lipschitz boundary if for every $y \in \partial\Omega$ there exist an isometry $\Psi: \mathbf{R}^d \rightarrow \mathbf{R}^d$, a real function $\tau \in W^{1,\infty}(\mathbf{R}^{d-1})$ and an $r > 0$ such that

$$\Omega \cap B_y(r) = \{\Psi(x_1, x') : (x_1, x') \in \mathbf{R} \times \mathbf{R}^{d-1}, \tau(x') < x_1\} \cap B_y(r) \quad (1)$$

where $B_y(r) = \{x \in \mathbf{R}^d : \|x - y\| < r\}$. Thus in a neighbourhood of y the boundary $\partial\Omega$ of Ω is the graph of a Lipschitz function τ , up to an isometry Ψ .

There are two variations of the theorem which will be established in the course of its proof.

First, for all $\psi \in C_c^\infty(\mathbf{R}^d)$ define Y_ψ as the L_2 -closure of the first-order partial differential operator

$$\varphi \mapsto \sum_{k,l=1}^d (\partial_k \psi) c_{kl} \partial_l \varphi$$

with domain $C_c^\infty(\mathbf{R}^d)$ and let T^ψ be the associated flow. Then invariance of $L_2(\Omega)$ under the $T^{(k)}$ is equivalent to invariance under the family of flows T^ψ . More precisely one has the following.

Proposition 1.2 *Let Ω be a measurable subset of $\mathbf{R}^d$. The following conditions are equivalent:*

- I. $T_t^\psi L_2(\Omega) = L_2(\Omega)$ for all $\psi \in C_c^\infty(\mathbf{R}^d)$ and $t \in \mathbf{R}$.
- II. $T_t^{(k)} L_2(\Omega) = L_2(\Omega)$ for all $k \in \{1, \dots, d\}$ and $t \in \mathbf{R}$.

This will be established in Section 2.

Secondly, the condition that $C_c^\infty(\mathbf{R}^d)$ is a core for H does not follow in general from the assumption that the coefficients are in $W^{1,\infty}(\mathbf{R}^d)$. The one-dimensional example considered in [ERSZ2], Section 5 gives a counterexample. Specifically, let $\delta \in [1/2, \infty)$ and $H = -d c d$ with $c(x) = |x|^{2\delta}(1+x^2)^{-\delta}$. Then $c \in W^{1,\infty}(\mathbf{R})$ but $C_c^\infty(\mathbf{R})$ is a core of H if and only if $\delta \geq 3/4$ by the arguments in [CMP], Proposition 3.5. (See also [RoS2].) In particular it is not a core if $\delta \in [1/2, 3/4)$. Nevertheless it follows that $C_c^\infty(\mathbf{R}^d)$ is a core for H if $c_{kl} \in W^{2,\infty}(\mathbf{R}^d)$ (see, [Rob1] Section 6, or [ElR2] Proposition 2.3). Moreover, the core condition can be derived from weaker smoothness assumptions on the c_{kl} (see Section 4).

2 Flows

In this section we derive some properties of the flows defined in Section 1 and prove Proposition 1.2. Although we deal primarily with the flows on $L_2(\mathbf{R}^d)$ we will need, in Section 3 some properties of their extensions to $L_\infty(\mathbf{R}^d)$. Therefore we begin by summarizing some general features of the flows.

Let $b_1, \dots, b_d \in W^{1,\infty}(\mathbf{R}^d)$ and define Y as the L_2 -closure of the first-order differential operator $\varphi \mapsto \sum_{k=1}^d b_k \partial_k \varphi$ and domain $W^{1,2}(\mathbf{R}^d)$. Further let T denote the flow generated by Y . Then for all $p \in [1, \infty]$ the group T leaves the subspace $L_2(\mathbf{R}^d) \cap L_p(\mathbf{R}^d)$ of $L_2(\mathbf{R}^d)$ invariant and T extends from $L_2(\mathbf{R}^d) \cap L_p(\mathbf{R}^d)$ to a flow $T^{[p]}$ on $L_p(\mathbf{R}^d)$ such that $T^{[p]}$ is strongly continuous if $p \in [1, \infty)$ and $T^{[\infty]}$ is weakly* continuous. The groups act in a consistent and compatible manner on the L_p -spaces. Moreover, $T^{[\infty]}$ is a group of automorphisms of $L_\infty(\mathbf{R}^d)$, i.e. $T_t^{[\infty]}(\psi \varphi) = (T_t^{[\infty]} \psi) (T_t^{[\infty]} \varphi)$ for all $\psi, \varphi \in L_\infty(\mathbf{R}^d)$ and $t \in \mathbf{R}$. Then since the L_∞ -functions are multipliers on the L_p -spaces one deduces that

$$T_t^{[p]}(\tau \varphi) = (T_t^{[\infty]} \tau) (T_t^{[p]} \varphi) \quad (2)$$

for all $\tau \in L_\infty(\mathbf{R}^d)$, $\varphi \in L_p(\mathbf{R}^d)$, $p \in [1, \infty]$ and $t \in \mathbf{R}$. If $Y_{[p]}$ is the generator of $T^{[p]}$ then $W^{1,p}(\mathbf{R}^d) \subset D(Y_{[p]})$ and $Y_{[p]} \varphi = \sum_{k=1}^d b_k \partial_k \varphi$ for all $\varphi \in W^{1,p}(\mathbf{R}^d)$.

These properties depend critically on the fact that Y is a first-order partial differential operator with coefficients $b_k \in W^{1,\infty}(\mathbf{R}^d)$. They can be verified either by general arguments of functional analysis (see, for example, [Rob2], Theorem V.4.1) or by methods of ordinary differential equations. The crucial observation in the latter context is that if $\varphi \in C_c^\infty(\mathbf{R}^d)$ then $(T_t \varphi)(x) = \varphi(\omega_t(x))$ where $t \mapsto \omega_t(x)$ is the unique solution of the differential equation $(d/dt)\omega_t(x) = b(\omega_t(x))$, with initial value $\omega_0(x) = x$ (see, for example, [Hil], Chapters 2 and 3).

Our first result is an approximation result which will be needed on $L_2(\mathbf{R}^d)$ but whose proof extends to the L_p -spaces.

Proposition 2.1 *Let $p \in [1, \infty]$. Let $Y_{[p]}$ denote the generator of the flow $T^{[p]}$ on $L_p(\mathbf{R}^d)$. Further let $\tau \in C_c^\infty(\mathbf{R}^d)$ with $\int \tau = 1$ and for all $n \in \mathbf{N}$ define $\tau_n \in C_c^\infty(\mathbf{R}^d)$ by $\tau_n(x) = n^d \tau(nx)$.*

*Then $\lim_{n \rightarrow \infty} Y_{[p]}(\tau_n * \varphi) = Y_{[p]} \varphi$ in $L_p(\mathbf{R}^d)$ for all $\varphi \in D(Y_{[p]})$ if $p < \infty$. If $p = \infty$ then $\lim_{n \rightarrow \infty} Y_{[\infty]}(\tau_n * \varphi) = Y_{[\infty]} \varphi$ weakly* in $L_\infty(\mathbf{R}^d)$ for all $\varphi \in D(Y_{[\infty]})$*

Proof First, for all $n \in \mathbf{N}$ define the bounded operator $B_n: L_p \rightarrow L_p$ by

$$B_n \varphi = \sum_{k=1}^d \tau_n * ((\partial_k b_k) \varphi) + \sum_{k=1}^d \int dy (\partial_k \tau_n)(y) \left((I - L_y) b_k \right) (L_y \varphi) \quad ,$$

where L denotes the left regular representation of $\mathbf{R}^d$, i.e. $(L_y \psi)(x) = \psi(x - y)$. Secondly, if $\varphi \in C_c^\infty$ and $n \in \mathbf{N}$ then

$$\begin{aligned} Y_{[p]}(\tau_n * \varphi) &= \sum_{k=1}^d b_k \int dy \tau_n(y) L_y \partial_k \varphi \\ &= \sum_{k=1}^d \int dy \tau_n(y) (b_k - L_y b_k) L_y \partial_k \varphi + \sum_{k=1}^d b_k \int dy \tau_n(y) L_y (b_k \partial_k \varphi) \quad . \end{aligned}$$

The second term equals $\tau_n * Y_{[p]} \varphi$. For the first term use $L_y \partial_k \varphi = -\frac{\partial}{\partial y_k} L_y \varphi$. Therefore integration by parts gives

$$Y_{[p]}(\tau_n * \varphi) - \tau_n * Y_{[p]} \varphi = \sum_{k=1}^d \int dy \frac{\partial}{\partial y_k} \left(\tau_n(y) (b_k - L_y b_k) \right) (L_y \varphi) = B_n \varphi \quad .$$

Since B_n is bounded one deduces by density that

$$Y_{[p]}(\tau_n * \varphi) - \tau_n * Y_{[p]}\varphi = B_n\varphi \quad (3)$$

for all $n \in \mathbf{N}$ and $\varphi \in D(Y_{[p]})$.

Thirdly, it follows from the definition of B_n that

$$\begin{aligned} \|B_n\varphi\|_p &\leq \sum_{k=1}^d \left(\|(\partial_k b_k) \varphi\|_p + \int dy |(\partial_k \tau_n)(y)| \|(I - L_y)b_k\| (L_y\varphi)\|_p \right) \\ &\leq \sum_{k=1}^d \|b_k\|_{W^{1,\infty}} \|\varphi\|_p + \sum_{k=1}^d \int dy |(\partial_k \tau_n)(y)| \|(I - L_y)b_k\|_\infty \|\varphi\|_p \end{aligned}$$

for all $n \in \mathbf{N}$ and $\varphi \in L_p$. But $\|(I - L_y)b_k\|_\infty \leq |y| \|b_k\|_{W^{1,\infty}}$ and $\int dy |(\partial_k \tau_n)(y)| |y| = \int dy |(\partial_k \tau)(y)| |y|$. Therefore $\|B_n\varphi\|_p \leq M \|\varphi\|_p$ uniformly for all $n \in \mathbf{N}$ and $\varphi \in L_p$, where $M = \sum_{k=1}^d (1 + \int dy |(\partial_k \tau)(y)| |y|) \|b_k\|_{W^{1,\infty}}$. The conclusion holds for all $p \in [1, \infty]$. So $B_1, B_2, \dots$ are equicontinuous.

Next assume $p < \infty$. If $\varphi \in W^{1,p}$ then $\lim_{n \rightarrow \infty} \tau_n * \varphi = \varphi$ in $W^{1,p}$. Consequently, $\lim_{n \rightarrow \infty} Y_{[p]}(\tau_n * \varphi) = Y_{[p]}\varphi$ strongly in L_p . Moreover, $\lim_{n \rightarrow \infty} \tau_n * (Y_{[p]}\varphi) = Y_{[p]}\varphi$ strongly in L_p . Therefore $\lim_{n \rightarrow \infty} B_n\varphi = 0$ in L_p for all $\varphi \in W^{1,p}$ by (3). Since $W^{1,p}$ is strongly dense in L_p and $B_1, B_2, \dots$ are equicontinuous it follows that $\lim_{n \rightarrow \infty} B_n\varphi = 0$ in L_p for all $\varphi \in L_p$. Finally, let $\varphi \in D(Y_{[p]})$. Then one establishes from (3) that $\lim_{n \rightarrow \infty} Y_{[p]}(\tau_n * \varphi) = \lim_{n \rightarrow \infty} (\tau_n * Y_{[p]}\varphi + B_n\varphi) = Y_{[p]}\varphi$ in L_p .

The argument for $p = \infty$ is very similar. If $\varphi \in W^{1,\infty}$ then $\lim \tau_n * \varphi = \varphi$ and $\lim \partial_k \tau_n * \varphi = \partial_k \varphi$ weakly*. Therefore $\lim Y_{[\infty]}(\tau_n * \varphi) = Y_{[\infty]}\varphi$ weak* on L_∞ . Then since $W^{1,\infty}$ is weakly* dense in L_∞ and $B_1, B_2, \dots$ are equicontinuous the desired conclusion follows as before. $\square$

Now we return to consideration of the vector fields $Y_1, \dots, Y_d$ defined in Section 1 acting on $L_2(\mathbf{R}^d)$.

Corollary 2.2 *Let τ and τ_n be as in Proposition 2.1. Then for all $\varphi \in \bigcap_{k=1}^d D(Y_k)$ one has $\lim_{n \rightarrow \infty} Y_k(\tau_n * \varphi) = Y_k\varphi$ for all $k \in \{1, \dots, d\}$.*

Note that convolution with τ_n maps $L_2(\mathbf{R}^d)$ into $W^{\infty,2}(\mathbf{R}^d)$ so the corollary establishes that $W^{\infty,2}(\mathbf{R}^d)$ is a simultaneous core for the $Y_1, \dots, Y_d$.

Now we turn to the proof of Proposition 1.2. Note that if T is a flow with generator Y then T -invariance of $L_2(\Omega)$ is equivalent to the commutation of Y and the operator of multiplication with $\mathbb{1}_\Omega$, i.e. if $\varphi \in D(Y)$ then $\mathbb{1}_\Omega\varphi \in D(Y)$ and $Y(\mathbb{1}_\Omega\varphi) = \mathbb{1}_\Omega Y\varphi$.

Proof of Proposition 1.2 “I $\Rightarrow$ II”. Let $k \in \{1, \dots, d\}$ and $U \subset \mathbf{R}^d$ a bounded open subset. There exist $\chi, \psi \in C_c^\infty(\mathbf{R}^d)$ such that $\chi|_U = \mathbb{1}$ and $\psi(x) = x_k$ for all $x \in \text{supp } \chi$. Then $Y_k(\chi\varphi) = Y_\psi(\chi\varphi)$ for all $\varphi \in C_c^\infty(\mathbf{R}^d)$. Since $\varphi \mapsto \chi\varphi$ is continuous on $D(Y_k)$ and on $D(Y_\psi)$, with the graph norm, it follows from Proposition 2.1 that $\chi\varphi \in D(Y_k)$ for all $\varphi \in D(Y_\psi)$. In particular, if $\varphi \in C_c^\infty(\mathbf{R}^d)$ with $\text{supp } \varphi \subset U$ then $\mathbb{1}_\Omega\varphi \in D(Y_\psi)$ and therefore $\mathbb{1}_\Omega\varphi = \chi\mathbb{1}_\Omega\varphi \in D(Y_k)$. Moreover, $Y_k(\mathbb{1}_\Omega\varphi) = Y_\psi(\chi\mathbb{1}_\Omega\varphi) = \mathbb{1}_\Omega Y_\psi(\chi\varphi) = \mathbb{1}_\Omega Y_k\varphi$. Then it follows by continuity that $\mathbb{1}_\Omega\varphi \in D(Y_k)$ and $Y_k(\mathbb{1}_\Omega\varphi) = \mathbb{1}_\Omega Y_k\varphi$ for all $\varphi \in D(Y_k)$. Therefore Condition II is valid.

“II $\Rightarrow$ I”. It follows from Condition II that $\mathbb{1}_\Omega \varphi \in D(Y_k)$ and $Y_k(\mathbb{1}_\Omega \varphi) = \mathbb{1}_\Omega Y_k \varphi$ for all $\varphi \in D(Y_k)$. Let $\psi \in C_c^\infty(\mathbf{R}^d)$. Then $Y_\psi \varphi = \sum_{k=1}^d (\partial_k \psi) Y_k \varphi$ for all $\varphi \in C_c^\infty(\mathbf{R}^d)$. Since the coefficients c_{kl} are in $W^{1,\infty}(\mathbf{R}^d)$ it follows from Corollary 2.2 that $\varphi \in D(Y_\psi)$ and $Y_\psi \varphi = \sum_{k=1}^d (\partial_k \psi) Y_k \varphi$ for all $\varphi \in \bigcap_{k=1}^d D(Y_k)$. Hence if $\varphi \in C_c^\infty(\mathbf{R}^d)$ then $\mathbb{1}_\Omega \varphi \in D(Y_\psi)$ and $Y_\psi(\mathbb{1}_\Omega \varphi) = \mathbb{1}_\Omega Y_\psi \varphi$. By density the latter extends to all $\varphi \in D(Y_\psi)$ and therefore Condition I is valid. $\square$

Finally we note that the flows T^ψ can be defined for all $\psi \in W^{2,\infty}(\mathbf{R}^d)$ and the conditions of Proposition 1.2 are equivalent to invariance of $L_2(\Omega)$ for all T_t^ψ with $\psi \in W^{2,\infty}(\mathbf{R}^d)$ and $t > 0$. This follows from the arguments of the foregoing proof.

3 Semigroup invariance

In this section we prove Theorem 1.1. First, however, we observe that Condition II of the theorem, the invariance of $L_2(\Omega)$ under the flows $T^{(k)}$ is equivalent to T^ψ -invariance of $L_2(\Omega)$ for all $\psi \in C_c^\infty(\mathbf{R}^d)$. This is a direct consequence of Proposition 1.2 which was established in the previous section. Therefore in the subsequent discussion we will consider the T^ψ -invariance condition.

Proof of Theorem 1.1 “I $\Rightarrow$ II”. It suffices, by the foregoing observation, to prove the T^ψ -invariance of $L_2(\Omega)$ for all $\psi \in C_c^\infty(\mathbf{R}^d)$.

First, it follows from the density of $C_c^\infty(\mathbf{R}^d)$ in $D(h)$ that there exists a unique bilinear map $\Gamma: D(h) \times D(h) \rightarrow L_1$, the *carré du champ*, such that

$$\Gamma(\psi, \varphi) = \sum_{k,l=1}^d c_{kl} (\partial_k \psi) (\partial_l \varphi)$$

for all $\psi, \varphi \in W^{1,2}(\mathbf{R}^d)$. Then $\|\Gamma(\psi, \varphi)\|_1 \leq h(\psi)^{1/2} h(\varphi)^{1/2}$ for all $\psi, \varphi \in D(h)$ by the Cauchy–Schwarz inequality. Moreover,

$$\int \tau \Gamma(\psi, \varphi) = \frac{1}{2} \left(h(\tau \psi, \varphi) + h(\psi, \tau \varphi) - h(\tau, \psi \varphi) \right) \quad (4)$$

for all $\tau, \psi, \varphi \in C_c^\infty(\mathbf{R}^d)$. But (4) then extends to all $\tau, \psi, \varphi \in D(h) \cap L_\infty$ by density.

Secondly, the form h is local in the sense that $h(\psi, \varphi) = 0$ for all $\psi, \varphi \in D(h)$ with $\psi \varphi = 0$ (see [Sch]). Therefore it follows from (4) that Γ is local in the same sense.

Thirdly, since $L_2(\Omega)$ is S -invariant the operation of multiplication by $\mathbb{1}_\Omega$ maps $D(h)$ into itself. Therefore if $\psi, \varphi, \tau \in D(h) \cap L_\infty$ then $\mathbb{1}_\Omega \varphi, \mathbb{1}_\Omega \tau \in D(h) \cap L_\infty$. By locality of h one deduces from (4) that

$$\begin{aligned} \int \tau \Gamma(\psi, \mathbb{1}_\Omega \varphi) &= \frac{1}{2} \left(h(\tau \psi, \mathbb{1}_\Omega \varphi) + h(\psi, \tau \mathbb{1}_\Omega \varphi) - h(\tau, \psi \mathbb{1}_\Omega \varphi) \right) \\ &= \frac{1}{2} \left(h(\mathbb{1}_\Omega \tau \psi, \varphi) + h(\psi, \mathbb{1}_\Omega \tau \varphi) - h(\mathbb{1}_\Omega \tau, \psi \varphi) \right) = \int \mathbb{1}_\Omega \tau \Gamma(\psi, \varphi) \quad . \end{aligned}$$

Hence $\Gamma(\psi, \mathbb{1}_\Omega \varphi) = \mathbb{1}_\Omega \Gamma(\psi, \varphi)$. But $D(h) \cap L_\infty$ is dense in $D(h)$. Therefore $\Gamma(\psi, \mathbb{1}_\Omega \varphi) = \mathbb{1}_\Omega \Gamma(\psi, \varphi)$ for all $\psi, \varphi \in D(h)$.

Now fix $\psi \in C_c^\infty(\mathbf{R}^d)$. Let $\tau \in C_c^\infty(\mathbf{R}^d)$. Then

$$((Y_\psi)^* \tau, \eta) = (\tau, Y_\psi \eta) = (\tau, \Gamma(\psi, \eta))$$

for all $\eta \in C_c^\infty(\mathbf{R}^d)$. Since $C_c^\infty(\mathbf{R}^d)$ is dense in $D(h)$ one deduces that $((Y_\psi)^* \tau, \eta) = (\tau, \Gamma(\psi, \eta))$ for all $\eta \in D(h)$. Choosing $\eta = \mathbb{1}_\Omega \varphi$ it follows that

$$((Y_\psi)^* \tau, \mathbb{1}_\Omega \varphi) = (\tau, \Gamma(\psi, \mathbb{1}_\Omega \varphi)) = (\mathbb{1}_\Omega \tau, \Gamma(\psi, \varphi)) = (\mathbb{1}_\Omega \tau, Y_\psi \varphi) = (\tau, \mathbb{1}_\Omega Y_\psi \varphi) \quad .$$

Since $C_c^\infty(\mathbf{R}^d)$ is a core for $(Y_\psi)^*$ one deduces that $\mathbb{1}_\Omega \varphi \in D(Y_\psi)$ and $Y_\psi(\mathbb{1}_\Omega \varphi) = \mathbb{1}_\Omega Y_\psi \varphi$. This conclusion then extends to all $\varphi \in D(Y_\psi)$ by density. Therefore $L_2(\Omega)$ is invariant under T^ψ .

The converse implication $\text{II} \Rightarrow \text{I}$ consists of two special cases.

Case 1. $C_c^\infty(\mathbf{R}^d)$ is a core for H .

Condition II is equivalent to T^ψ invariance of $L_2(\Omega)$ for all $\psi \in C_c^\infty(\mathbf{R}^d)$ by Proposition 1.2. Therefore we assume the latter condition.

Let $\psi, \tau \in C_c^\infty(\mathbf{R}^d)$. Then

$$(H\psi, \tau \varphi) = h(\psi, \tau \varphi) = \int \Gamma(\psi, \tau \varphi) = \int \tau \Gamma(\psi, \varphi) + \varphi \Gamma(\psi, \tau) = (\tau, Y_\psi \varphi) + (\varphi, Y_\psi \tau)$$

for all $\varphi \in C_c^\infty(\mathbf{R}^d)$. Since $C_c^\infty(\mathbf{R}^d)$ is dense in $D(Y_\psi)$ one deduces that

$$(H\psi, \tau \varphi) = (\tau, Y_\psi \varphi) + (\varphi, Y_\psi \tau) \quad (5)$$

for all $\varphi \in D(Y_\psi)$.

Now let $\psi, \tau, \varphi \in C_c^\infty(\mathbf{R}^d)$. Then by T^ψ -invariance of $L_2(\Omega)$ and (5) one deduces that $\mathbb{1}_\Omega \varphi \in D(Y_\psi)$ and

$$\begin{aligned} (H\psi, \tau \mathbb{1}_\Omega \varphi) &= (\tau, Y_\psi(\mathbb{1}_\Omega \varphi)) + (\mathbb{1}_\Omega \varphi, Y_\psi \tau) \\ &= (\mathbb{1}_\Omega \tau, Y_\psi \varphi) + (\mathbb{1}_\Omega \varphi, Y_\psi \tau) = (\mathbb{1}_\Omega \tau, \Gamma(\psi, \varphi)) + (\mathbb{1}_\Omega \varphi, \Gamma(\psi, \tau)) \quad . \end{aligned}$$

Therefore

$$|(H\psi, \tau \mathbb{1}_\Omega \varphi)| \leq \|\mathbb{1}_\Omega \tau\|_\infty \|\Gamma(\psi, \varphi)\|_1 + \|\mathbb{1}_\Omega \varphi\|_\infty \|\Gamma(\psi, \tau)\|_1 \leq c h(\psi)^{1/2} \leq c \|(I + H)^{1/2} \psi\|_2$$

where $c = \|\tau\|_\infty h(\varphi)^{1/2} + \|\varphi\|_\infty h(\tau)^{1/2}$. This estimate is uniform for all $\psi \in C_c^\infty(\mathbf{R}^d)$. Since by assumption the space $C_c^\infty(\mathbf{R}^d)$ is a core for $D(H)$ it follows that $\mathbb{1}_\Omega \tau \varphi \in D(H^{1/2}) = D(h)$ for all $\tau, \varphi \in C_c^\infty(\mathbf{R}^d)$. But $\text{span}(C_c^\infty(\mathbf{R}^d) \cdot C_c^\infty(\mathbf{R}^d))$ is dense in $D(h)$. Therefore it follows from [ElR1], Proposition 2.1 $\text{III} \Rightarrow \text{I}$, that S leaves $L_2(\Omega)$ invariant. This completes the proof of the first case in the proof of $\text{II} \Rightarrow \text{I}$.

Case 2. $\partial\Omega$ is (locally) Lipschitz.

Let P_Ω be the orthogonal projection of $L_2(\mathbf{R}^d)$ onto $L_2(\Omega)$. By assumption T^ψ leaves $L_2(\Omega)$ invariant for all $\psi \in C_c^\infty(\mathbf{R}^d)$. Hence

$$T_t^\psi P_\Omega = P_\Omega T_t^\psi P_\Omega \quad (6)$$

for all $t \in \mathbf{R}$. Let B denote multiplication by the bounded function $\sum_{k,l=1}^d (\partial_k \psi)(\partial_l c_{kl})$ and set $M_t = e^{-tB}$ for $t \in \mathbf{R}$. Clearly each M_t leaves $L_2(\Omega)$ invariant. Therefore $(T_{-t/n}^\psi M_{-t/n})^n$

leaves $L_2(\Omega)$ invariant for all $t \in \mathbf{R}$ and $n \in \mathbf{N}$. But $(Y_\psi)^* = -Y_\psi - B$. Then the Trotter product formula establishes that $(T_t^\psi)^*$ is the strong limit of $(T_{-t/n}^\psi M_{-t/n})^n$ as $n \rightarrow \infty$. So $(T_t^\psi)^*$ leaves $L_2(\Omega)$ invariant. Hence $(T_t^\psi)^* P_\Omega = P_\Omega (T_t^\psi)^* P_\Omega$ for all $t \in \mathbf{R}$. Therefore $P_\Omega T_t^\psi = P_\Omega T_t^\psi P_\Omega$ and by (6) it follows that $T_t^\psi P_\Omega = P_\Omega T_t^\psi$ for all $t \in \mathbf{R}$. Then

$$\mathbb{1}_\Omega T_t^\psi \varphi = P_\Omega T_t^\psi \varphi = T_t^\psi P_\Omega \varphi = T_t^\psi (\mathbb{1}_\Omega \varphi) = (T_t^{\psi, \infty} \mathbb{1}_\Omega) (T_t^\psi \varphi)$$

for all $\varphi \in C_c^\infty(\mathbf{R}^d)$ and $t \in \mathbf{R}$ where $T^{\psi, \infty}$ denotes the extension of the flow T^ψ to $L_\infty(\mathbf{R}^d)$ (see Section 2) and we have used (2). Since $T_t^\psi(C_c^\infty(\mathbf{R}^d))$ is dense in $L_2(\mathbf{R}^d)$ one deduces that $T_t^{\psi, \infty} \mathbb{1}_\Omega = \mathbb{1}_\Omega$ for all $t \in \mathbf{R}$.

Next let $\varphi \in C_c^\infty(\mathbf{R}^d)$. Then $(Y_\psi)^* \varphi \in L_1(\mathbf{R}^d) \cap L_2(\mathbf{R}^d)$, so $(Y_\psi^{(\infty)})^* \varphi = (Y_\psi)^* \varphi$, where $Y_\psi^{(\infty)}$ is the generator of $T^{\psi, \infty}$. Since $((T_t^{\psi, \infty})^* \varphi, \mathbb{1}_\Omega) = (\varphi, T_t^{\psi, \infty} \mathbb{1}_\Omega) = (\varphi, \mathbb{1}_\Omega)$ for all $t \in \mathbf{R}$ it follows by differentiation that $((Y_\psi)^* \varphi, \mathbb{1}_\Omega) = 0$. Therefore setting $\Phi_k = \sum_{l=1}^d c_{kl} \partial_l \psi$ for $k \in \{1, \dots, d\}$ one has

$$\int_\Omega \operatorname{div}(\varphi \Phi) = ((Y_\psi)^* \varphi, \mathbb{1}_\Omega) = 0 \quad . \quad (7)$$

At this point we use the (local) Lipschitz continuity of $\partial\Omega$.

The Gauss–Green theorem is valid for open sets Ω with a (locally) Lipschitz boundary (see, for example, [EvG] page 209). It states that

$$\int_\Omega \operatorname{div} \Psi = \int_{\partial\Omega} dS \langle n, \Psi \rangle$$

for all $\Psi \in W^{1, \infty}(\mathbf{R}^d)$ with compact support where $\langle \cdot, \cdot \rangle$ denotes the inner product on $\mathbf{R}^d$, dS is the Euclidean measure on $\partial\Omega$ and n is the unit outward normal to $\partial\Omega$. The normal is defined dS -almost everywhere. Thus if one sets $\Psi = \varphi \Phi$ with $\varphi \in C_c^\infty(\mathbf{R}^d)$ one has

$$\int_\Omega \operatorname{div}(\varphi \Phi) = \int_{\partial\Omega} dS \varphi \langle n, \Phi \rangle = 0$$

where the last equality uses (7). Since this is valid for all $\varphi \in C_c^\infty(\mathbf{R}^d)$ it follows that $\langle n, \Phi \rangle = 0$ almost everywhere on $\partial\Omega$. Therefore $\langle (\nabla \psi)(x), C(x) n_x \rangle = 0$ for almost every $x \in \partial\Omega$. But this is also valid for all $\psi \in C_c^\infty(\mathbf{R}^d)$. Hence one must have $C(x) n_x = 0$ for almost every $x \in \partial\Omega$. This corresponds to the condition of zero flux across the boundary as defined in [RoS1] and then the S -invariance of $L_2(\Omega)$ follows from Theorem 1.2 of this reference. $\square$

The argument in [RoS1] that zero flux implies invariance is somewhat indirect as it first proves that the capacity of $\partial\Omega$ with respect to h is zero and then uses this to deduce the S -invariance of $L_2(\Omega)$. Nevertheless, the same reasoning can be adapted to give a direct proof of the invariance since the proof can be reduced to a local estimate as in [RoS1]. (The latter proof and this proof are an adaption of the argument used to prove Proposition 6.5 in [ERSZ2].)

First, it suffices to prove that if $\varphi \in C_c^\infty(\mathbf{R}^d)$ then $\mathbb{1}_\Omega \varphi \in D(h)$. This is a consequence of [EIR1] Proposition 2.1 and locality of h . But this is obvious if the support of φ and the boundary are disjoint. Therefore it suffices to consider φ with support close to the boundary $\partial\Omega$. Then, however, one can use a decomposition of the identity to reduce to the case $\operatorname{supp} \varphi \subset B_y(r)$ with $y \in \partial\Omega$ and $r > 0$ small.

Secondly, let τ, Ψ be as in (1). Without loss of generality we may assume that $\Psi(x) = x$ for all $x \in \mathbf{R}^d$. For all $n \in \mathbf{N}$ define $\psi_n: \mathbf{R}^d \rightarrow \mathbf{R}$ by $\psi_n(x) = \chi_n(x_1 - \tau(x'))$, where $x = (x_1, x') \in \mathbf{R} \times \mathbf{R}^{d-1}$ and $\chi_n: \mathbf{R} \rightarrow \mathbf{R}$ is defined by

$$\chi_n(t) = \begin{cases} 0 & \text{if } t \leq 1/n, \\ \log(tn)/\log n & \text{if } 1/n < t < 1, \\ 1 & \text{if } t \geq 1. \end{cases}$$

Then $\lim(\psi_n \varphi) = \mathbb{1}_\Omega \varphi$ in $L_2(\mathbf{R}^d)$. Thus to establish that $\mathbb{1}_\Omega \varphi \in D(h)$ it suffices to prove that $\{h(\psi_n \varphi) : n \in \mathbf{N}\}$ is bounded. But

$$\begin{aligned} h(\psi_n \varphi) &\leq 2h(\varphi) + 2 \int |\varphi|^2 \sum_{k,l=1}^d c_{kl} (\partial_k \psi_n) (\partial_l \psi_n) \\ &\leq 2h(\varphi) + 2(\log n)^{-2} \int_{\mathbf{R}^{d-1}} dx' \int_{\tau(x')+1/n}^{\tau(x')+1} dx_1 |\varphi(x)|^2 \frac{\langle \nu_x, C(x) \nu_x \rangle}{(x_1 - \tau(x'))^2} \end{aligned}$$

for all $n \in \mathbf{N}$ where $\nu_x = (1, -(\nabla \tau)(x'))$. Since the coefficients c_{kl} are in $W^{1,\infty}(\mathbf{R}^d)$ there exists an $M > 0$ such that $|\langle \xi, C(x)\xi \rangle - \langle \xi, C(z)\xi \rangle| \leq M \|\xi\|^2$ for all $x, z, \xi \in \mathbf{R}^d$. If $x = (x_1, x') \in B_y(r)$, the function τ is differentiable at x' and $x_1 = \tau(x')$ then

$$\langle \nu_x, C(\tau(x'), x') \nu_x \rangle = (1 + |(\nabla \tau)(x')|^2) \langle n_x, C(\tau(x'), x') n_x \rangle = 0$$

by the zero flux condition. Hence $\langle \nu_x, C(x_1, x') \nu_x \rangle \leq M_1 |x_1 - \tau(x')|$ for all $x = (x_1, x') \in B_y(r)$ with τ differentiable at x' , where $M_1 = M(1 + \|\nabla \tau\|_\infty)^2$. It follows that

$$\begin{aligned} &(\log n)^{-2} \int_{\mathbf{R}^{d-1}} dx' \int_{\tau(x')+1/n}^{\tau(x')+1} dx_1 |\varphi(x_1, x')|^2 \frac{\langle \nu_x, C(x_1, x') \nu_x \rangle}{(x_1 - \tau(x'))^2} \\ &\leq M_1 (\log n)^{-2} \int_{\mathbf{R}^{d-1}} dx' \int_{\tau(x')+1/n}^{\tau(x')+1} dx_1 \frac{|\varphi(x_1, x')|^2}{(x_1 - \tau(x'))} \leq M_1 (\log n)^{-1} \|\varphi\|_\infty^2 |K'| \end{aligned}$$

uniformly for all $n \in \mathbf{N}$, where $K' \subset \mathbf{R}^{d-1}$ is a compact set such that $\text{supp } \varphi \subset \mathbf{R} \times K'$. So $\{h(\psi_n \varphi) : n \in \mathbf{N}\}$ is bounded, as required. In fact a slightly more detailed argument establishes that $\lim h(\psi_n \varphi - \mathbb{1}_\Omega \varphi) = 0$.

4 Core properties

In this section we examine conditions which ensure that $C_c^\infty(\mathbf{R}^d)$ is a core for the degenerate elliptic operator H with coefficients (c_{kl}) in $W^{1,\infty}$. Obviously $C_c^\infty(\mathbf{R}^d)$ is a core for H if and only if $W^{2,\infty}(\mathbf{R}^d)$ is a core for H .

First, we recall two known core criteria.

Theorem 4.1 *If one of the following two conditions is valid then $C_c^\infty(\mathbf{R}^d)$ is a core for H :*

- I. $c_{kl} \in W^{2,\infty}(\mathbf{R}^d)$ for all $k, l \in \{1, \dots, d\}$,
- II. the matrix $(c_{kl}(x))$ is invertible for all $x \in \mathbf{R}^d$.

Proof If Condition I is valid then $C_c^\infty(\mathbf{R}^d)$ is a core by [Rob1] Section 6, or [ELR2] Proposition 2.3, or by an adaption of the proof of Proposition 2.1. If Condition II is valid then $C_c^\infty(\mathbf{R}^d)$ is a core by the arguments in [Dav] Theorem 3.1. Davies requires that the coefficients are smooth, but if the coefficients are bounded the smoothness condition can be relaxed to $W^{1,\infty}$. $\square$

We shall prove a core theorem with a mixture of the two conditions of Theorem 4.1 in Corollary 4.5.

Lemma 4.2 *If $\chi \in W^{2,\infty}(\mathbf{R}^d)$ and $\varphi \in D(H)$ then $\chi\varphi \in D(H)$.*

Fix $\chi \in W^{2,\infty}(\mathbf{R}^d)$. Then it follows from Lemma 3.4 in [ERSZ1] that $\chi\varphi \in D(h)$ and $h(\chi\varphi)^{1/2} \leq \|\chi\|_\infty h(\varphi)^{1/2} + \|\Gamma(\chi)\|_\infty^{1/2} \|\varphi\|_2$ for all $\varphi \in D(h)$, where we define $\Gamma(\chi) = \sum_{k,l=1}^d c_{kl}(\partial_k \chi)(\partial_l \chi) \in L_\infty$. If $\varphi, \psi \in C_c^\infty$ then

$$h(\psi, \chi\varphi) = h(\chi\psi, \varphi) - \sum_{k,l=1}^d \int \psi \varphi (\partial_k c_{kl} \partial_l \chi) - 2 \sum_{k,l=1}^d \int c_{kl} (\partial_k \varphi) (\partial_l \chi) \psi \quad .$$

So

$$|h(\psi, \chi\varphi)| \leq |h(\chi\psi, \varphi)| + a \|\psi\|_2 \|\varphi\|_2 + 2h(\varphi)^{1/2} \|\Gamma(\chi)\|_\infty^{1/2} \|\psi\|_2 \quad , \quad (8)$$

where $a = \|\sum \partial_k c_{kl} \partial_l \chi\|_\infty$. Then by continuity (8) is valid for all $\psi, \varphi \in D(h)$. Finally, if $\varphi \in D(H)$ then $|h(\chi\psi, \varphi)| = |(\chi\psi, H\varphi)| \leq \|H\varphi\|_2 \|\chi\|_\infty \|\psi\|_2$ for all $\psi \in D(h)$. Using (8) it follows that there exists a $c > 0$ such that $|h(\psi, \chi\varphi)| \leq c \|\psi\|_2$ for all $\psi \in D(h)$. Therefore $\chi\varphi \in D(H)$. $\square$

If $A \subset \mathbf{R}^d$ with $A \neq \emptyset$ and $\delta > 0$ define the open set $A_\delta \subset \mathbf{R}^d$ by $A_\delta = \{x \in \mathbf{R}^d : d(x, A) < \delta\}$.

Lemma 4.3 *Let H_1 and H_2 be degenerate elliptic operators with $W^{1,\infty}$ -coefficients $(c_{kl}^{(1)})$ and $(c_{kl}^{(2)})$ and let $h^{(1)}$ and $h^{(2)}$ be the corresponding quadratic forms. Let $U \subset \mathbf{R}^d$ be an open set and suppose that $c_{kl}^{(1)}|_U = c_{kl}^{(2)}|_U$ for all $k, l \in \{1, \dots, d\}$. Let $\varphi \in L_2(\mathbf{R}^d) \setminus \{0\}$ and suppose that $(\text{supp } \varphi)_\delta \subset U$.*

Then $\varphi \in D(h^{(1)})$ if and only if $\varphi \in D(h^{(2)})$ and then $h^{(1)}(\varphi) = h^{(2)}(\varphi)$. Similarly, $\varphi \in D(H_1)$ if and only if $\varphi \in D(H_2)$ and then $H_1\varphi = H_2\varphi$. Moreover, $\text{supp } H_1\varphi \subseteq \text{supp } \varphi$.

Proof There exists a $\chi \in W^{2,\infty}(\mathbf{R}^d)$ such that $\chi|_{\text{supp } \varphi} = 1$ and $\text{supp } \chi \subset U$. Suppose $\varphi \in D(h^{(1)})$. Then there exists a sequence $\varphi_1, \varphi_2, \dots \in W^{1,2}(\mathbf{R}^d)$ such that $\lim \varphi_n = \varphi$ in $D(h^{(1)})$. Then $\lim \varphi_n = \varphi$ in $L_2(\mathbf{R}^d)$. But $h^{(1)}(\chi\varphi_n) = h^{(2)}(\chi\varphi_n)$ and $h^{(1)}(\chi\varphi_n - \chi\varphi_m) = h^{(2)}(\chi\varphi_n - \chi\varphi_m)$ for all $n, m \in \mathbf{N}$. Therefore $\chi\varphi_1, \chi\varphi_2$ is a Cauchy sequence in $D(h^{(2)})$. Since $\lim \chi\varphi_n = \varphi$ in L_2 one deduces that $\varphi \in D(h^{(2)})$ and $h^{(2)}(\varphi) = h^{(1)}(\varphi)$.

Finally suppose that $\varphi \in D(H_1)$. If $\psi \in C_c^\infty(\mathbf{R}^d)$ with $\text{supp } \psi \subset (\text{supp } \varphi)^c$ then $(H_1\varphi, \psi) = h^{(1)}(\varphi, \psi) = 0$ by locality. Therefore $\text{supp } H_1\varphi \subseteq \text{supp } \varphi$. Clearly $\varphi \in D(h^{(1)})$ and by the first part, also $\varphi \in D(h^{(2)})$. Let $\psi \in D(h^{(2)})$. Then $\chi\psi \in D(h^{(2)})$ and $\text{supp } \chi\psi \subset U$. Therefore $\chi\psi \in D(h^{(1)})$. Then by locality one deduces that $h^{(2)}(\varphi, \psi) = h^{(2)}(\varphi, \chi\psi) + h^{(2)}(\varphi, (1-\chi)\psi) = h^{(2)}(\varphi, \chi\psi) = h^{(1)}(\varphi, \chi\psi)$. So $|h^{(2)}(\varphi, \psi)| = |h^{(1)}(\varphi, \chi\psi)| = |(H_1\varphi, \chi\psi)| \leq \|H_1\varphi\|_2 \|\chi\|_\infty \|\psi\|_2$. Therefore $\varphi \in D(H_2)$. If $\psi \in C_c^\infty(U)$ then $(H_1\varphi, \psi) = (\varphi, H_1\psi) = (\varphi, H_2\psi) = (H_2\varphi, \psi)$. Since $\text{supp } H_1\varphi \subseteq U$ and $\text{supp } H_2\varphi \subseteq U$ it follows that $H_1\varphi = H_2\varphi$. $\square$

Proposition 4.4 *Let $A \subset \mathbf{R}^d$, $\delta > 0$, let H_1 and H_2 be degenerate elliptic operators with $W^{1,\infty}$ -coefficients $(c_{kl}^{(1)})$ and $(c_{kl}^{(2)})$. Suppose $\emptyset \neq A \neq \mathbf{R}^d$, $c_{kl}^{(1)}|_{A_\delta} = c_{kl}|_{A_\delta}$ and $c_{kl}^{(2)}|_{(A^c)_\delta} = c_{kl}|_{(A^c)_\delta}$ for all $k, l \in \{1, \dots, d\}$ and $C_c^\infty(\mathbf{R}^d)$ is a core for both H_1 and H_2 . Then $C_c^\infty(\mathbf{R}^d)$ is a core for H .*

Proof Let $\tau \in C_c^\infty(\mathbf{R}^d)$ be such that $\int \tau = 1$ and $\tau(x) = 0$ for all $x \in \mathbf{R}^d$ with $|x| > \frac{\delta}{4}$. Let $\chi = \tau * \mathbb{1}_{A_{\delta/2}}$. Then $\chi \in W^{2,\infty}(\mathbf{R}^d)$, $\chi|_{A_{\delta/4}} = \mathbb{1}$ and $\text{supp } \chi \subset A_{3\delta/4}$. Moreover, $\text{supp}(\mathbb{1} - \chi) \subset (A_{\delta/4})^c \subset A^c$. There exist $\chi_1, \chi_2 \in W^{\infty,\infty}(\mathbf{R}^d)$ such that $\chi_1|_{A_{3\delta/4}} = \mathbb{1}$, $\text{supp } \chi_1 \subset A_\delta$, $\chi_2|_{A^c} = \mathbb{1}$ and $\text{supp } \chi_2 \subset (A^c)_\delta$.

Let $\varphi \in D(H)$. It follows from Lemma 4.2 that $\chi\varphi \in D(H)$ and $(\mathbb{1} - \chi)\varphi \in D(H)$. We shall show that we can approximate both elements by C_c^∞ -functions. We may assume that $\chi\varphi \neq 0 \neq (\mathbb{1} - \chi)\varphi$. Since $\text{supp}(\chi\varphi) \subset A_{3\delta/4}$ one deduces from Lemma 4.3 that $\chi\varphi \in D(H_1)$ and $H_1(\chi\varphi) = H(\chi\varphi)$. By assumption there exist $\varphi_1, \varphi_2, \dots \in C_c^\infty(\mathbf{R}^d)$ such that $\lim \varphi_n = \chi\varphi$ in $D(H_1)$. Then $\lim \chi_1\varphi_n = \chi_1\chi\varphi = \chi\varphi$ in $D(H_1)$ by Lemma 4.2. But $\chi_1\varphi_n \in C_c^\infty(\mathbf{R}^d)$ and $\text{supp } \chi_1\varphi_n \subset A_\delta$ for all $n \in \mathbf{N}$. Therefore $\chi_1\varphi_n \in D(H)$ and $H(\chi_1\varphi_n) = H_1(\chi_1\varphi_n)$, again by Lemma 4.3. So $\lim \chi_1\varphi_n = \chi\varphi$ in $D(H)$. Similarly, using H_2 and χ_2 there exists a sequence $\psi_1, \psi_2, \dots \in C_c^\infty(\mathbf{R}^d)$ such that $\lim \chi_2\psi_n = (\mathbb{1} - \chi)\varphi$ in $D(H)$. Then $\lim(\chi_1\varphi_n + \chi_2\psi_n) = \varphi$ in $D(H)$. Since $\chi_1\varphi_n + \chi_2\psi_n \in C_c^\infty(\mathbf{R}^d)$ the proposition follows. $\square$

Corollary 4.5 *Suppose there exist a set A and $\delta > 0$ such that $\emptyset \neq A \neq \mathbf{R}^d$, the matrix $(c_{kl}(x))$ is invertible for all $x \in (A^c)_\delta$ and $c_{kl}|_{A_\delta} \in W^{2,\infty}(A_\delta)$. Then $C_c^\infty(\mathbf{R}^d)$ is a core for H .*

Proof There exists a $\chi_1 \in W^{2,\infty}(\mathbf{R}^d)$ such that $\chi_1|_{A_{\delta/2}} = \mathbb{1}$ and $\text{supp } \chi_1 \subset A_\delta$. Define $c_{kl}^{(1)} = \chi_1 c_{kl} \in W^{2,\infty}(\mathbf{R}^d)$. Then $c_{kl}^{(1)}|_{A_{\delta/2}} = c_{kl}|_{A_{\delta/2}}$.

There exists a $\chi_2 \in W^{1,\infty}(\mathbf{R}^d)$ such that $\chi_2|_{(A^c)_{\delta/2}} = \mathbb{1}$ and $\text{supp } \chi_2 \subset (A^c)_\delta$. Define $c_{kl}^{(2)} = \chi_2 c_{kl} + (\mathbb{1} - \chi_2)\delta_{kl} \in W^{1,\infty}(\mathbf{R}^d)$. Let H_1 and H_2 be the degenerate elliptic operator with coefficients $(c_{kl}^{(1)})$ and $(c_{kl}^{(2)})$. Now apply Theorem 4.1.I to H_1 , Theorem 4.1.II to H_2 and use Proposition 4.4. $\square$
